Coauthor contribution statement

I co-authored the paper

Lorenzo Clemente, Sławomir Lasota,
Timed Pushdown Automata Revisited, LICS 2015: 738-749.

This paper contains three results on timed extensions of pushdown automata: collapse of the previously proposed model to untimed stack (mostly by Lorenzo Clemente), proposal of its proper extension (timed register automata, by me in collaboration with Lorenzo Clemente), and decidability of the non-emptiness problem for a large subclass of this extended model (mostly by me).

All the results were obtained in close collaboration between me and Lorenzo Clemente. Our contributions are comparable, with my contribution slightly less significant than Lorenzo's one.

Best regards,

prof. Sławomir Lasota
